

Oncological surgery

At the Centre of General and Oncological Surgery at East Tallinn Central Hospital we diagnose and treat all tumours of organ systems within our field of activity:

- gastrointestinal tumours,
- skin tumours and melanoma,
- soft tissue (muscle tissue, fat tissue, connective tissue) tumours,
- endocrine system organ (glands) tumours,
- breast tumours.

The surgeons of the centre have specialised in the surgery of the tumours of different organs. This ensures a good experience and consistent training and it allows one to dive deeper into the world of tumours and newer related achievements.
