

Instrumental lymphatic massage

Lymphatic drainage promotes the flow of lymph in the lymphatic system. The goal is to stimulate lymphatic circulation and to improve the drainage of fluids and waste matter in the organism. The Lymphastim BTL device operates on the principle of periodic compression. The drainage parameters, pressure, compressions and pause duration are configurable. The tissues are affected by cuffs, which cover specifically constructed junctions and which are inflated in a specific order.

The duration and frequency of the procedure is prescribed by the doctor. A physician's referral is necessary to receive the service. The service is paid.
