

GRAIL – gait analysis and gait training system 60 min

GRAIL is a device for performing gait analysis (60 min) and training (30 min). It allows extremely detailed real-time gait analysis to be conducted and the results saved for subsequent use to clarify the patient's problems and/or adjust their therapy.

The GRAIL system is ideal for patients with neurological, orthopaedic and musculoskeletal conditions who need gait analysis or gait training.

By using a projection system, treadmill and infrared cameras, GRAIL creates a virtual environment for gait, running and balance training sessions.

The service is paid.
